

## 5 Rules of Pseudocode

Jadon Kosberg

1. Write one statement per. This means each line represents a single logical step.
2. Capitalize initial keywords like READ WRITE IF WHILE UNTIL. Also keep variables lowercase. This helps make it more readable and be able to distinguish the logic flow and data.
3. Indent to show the hierarchy. This helps to show what statements belong in.
4. Use standard keywords. Some of these include BEGIN END IF THEN ELSE WHILE FOR...
5. Keep statements language. Use plain English mixed with keywords and avoid language specific syntax like semicolons.
